01_CATALOG_DOMAIN_v2_FREEZE_CANDIDATE.md

01_CATALOG_DOMAIN_v2_FREEZE_CANDIDATE.md

This page consolidates the required corrections identified during the architecture review and is intended to supersede the previous Conceptual Entity Pass draft.

01_CATALOG_DOMAIN_CONCEPTUAL_ENTITY_PASS.md + 01_CATALOG_DOMAIN_v2_FREEZE_CANDIDATE.mdRequired Corrections Applied

1. Same Work vs New Edition Clarification

Add immediately after the 'Same Work Versus New Work' section:

> These changes do not normally create a new `OrigamiWork`. Some of them may create a new `OrigamiEdition` when they establish a distinct published, translated, reconstructed, or otherwise curated expression of the work.

---

2. OrigamiEdition Definition Refined

Replace:

> A distinct published, translated, reconstructed, adapted, revised, or otherwise curated expression of exactly one `OrigamiWork`.

With:

> A distinct published, translated, reconstructed, adapted, or otherwise curated expression of exactly one `OrigamiWork`.A revised release constitutes a new edition only when it is intentionally assigned a distinct edition or publication identity.

---

3. Edition Titles (Resolved Open Question)

Decision:

Code — Plain Text

```
YES
```

Introduce future entity:

Code — Plain Text

```
EditionTitle
```

Relationship:

Code Plain Text

```
OrigamiEdition
    1 ——— 0..* EditionTitle

```

Status:

Code Plain Text

```
Conceptually approved
Phase 2 implementation

```

MVP:

Plain Text

```
OrigamiEdition.title

```

is retained as a display field.

---

4. WorkTitle Preferred Rule Clarification

Replace:

> At most one title should be preferred for the same work and language within the same preference context.

With:

> At most one `WorkTitle` may be preferred for the same work and language.If multiple preference contexts are later required, the model must introduce an explicit context entity rather than rely on application-specific behavior.

Also clarify:

Plain Text

```
title_type
    = semantic role

preferred
    = display selection

```

---

5. WorkRelationship Status Correction

Replace:

Code Plain Text

```
status
```

with:

Code — Plain Text

```
relationship_status
```

Controlled values:

Code — Plain Text

```
Claimed
Unverified
Verified
Disputed
Deprecated
```

Provenance state remains external to Catalog and belongs to the Provenance Domain.

---

6. Revision Attributes Expanded

Replace Revision attributes with:

Code — Plain Text

```
id
edition_id
revision_number
revision_label
revision_date
summary
created_at
```

Rule:

Code — Plain Text

```
revision_number
or
revision_label
must be unique within an edition when supplied
```

---

7. Imported Claims Handling Clarified

Catalog does not own imported title claims.

Flow:

Code Plain Text

```
Imported metadata
        ↓
Provenance / Extracted Metadata
        ↓
Curated Acceptance
        ↓
WorkTitle / EditionTitle

```

Imported metadata never becomes authoritative Catalog knowledge automatically.

---

8. ExternalReference Scope Clarified

Phase 1:

Code Plain Text

```
ExternalReference
    → OrigamiEdition

```

Future:

Code Plain Text

```
ExternalReference
    → OrigamiWork
    → OrigamiEdition
    → Party
    → Technique
    → Base

```

---

9. Slug Reclassified

`slug` is no longer treated as a purely conceptual attribute.

Classification:

Code Plain Text

```
Implementation Support Field

```

Description:

Code Plain Text

```
Stable URL-safe identifier used by applications.

```

The same note applies to:

Code Plain Text

```
created_at
updated_at

```

---

10. PublicationContainer (Resolved Open Question)

Decision:

Code Plain Text

```
YES

```

Future Catalog entities:

Code Plain Text

```
PublicationContainer
PublicationOccurrence

```

Examples:

Code Plain Text

```
Book
Magazine Issue
Website
Repository
Exhibition Catalog
Proceedings Volume

```

Relationships:

Code Plain Text

```
PublicationContainer
    1 ——— 0..* PublicationOccurrence

OrigamiEdition
    1 ——— 0..* PublicationOccurrence

```

Status:

Code Plain Text

```
Future Catalog Expansion

```

---

11. Lifecycle Statuses Standardized (Resolved Open Question)

OrigamiWork

Code — Plain Text

```
Draft
Published
Archived
Deprecated
Merged

```

OrigamiEdition

Code — Plain Text

```
Draft
Published
Archived
Deprecated

```

WorkRelationship

Code — Plain Text

```
Claimed
Unverified
Verified
Disputed
Deprecated

```

Revision

No MVP status required.

Future candidates:

Code — Plain Text

```
Draft
Published
Superseded
Withdrawn

```

---

12. Symmetric Related To Storage (Resolved Open Question)

Decision:

```
Store once
```

Conceptually:

```
Work A Related To Work B
```

is identical to:

```
Work B Related To Work A
```

Relational implementations should normalize endpoint ordering and prevent duplicate reciprocal records.

Freeze Candidate Outcome

Resolved:

- Edition multilingual titles
- PublicationContainer strategy
- Lifecycle status vocabulary
- Symmetric relationship storage

Remaining non-blocking questions:

- Exact PublicationContainer subtype hierarchy
- EditionTitle implementation timing
- Whether Series belongs in Catalog Phase 2 or later

Catalog Domain Status

```
Architecture Review: Passed
Conceptual Entity Pass: Completed
Status: Freeze Candidate
```
